(54) Title: OBJECT-BASED AUDIO-VISUAL TERMINAL AND BITSTREAM STRUCTURE

(57) Abstract

As information to be processed at an object-based video or audio-visual (AV) terminal, an object-oriented bitstream includes objects, composition information, and scene demarcation information. Such bitstream structure allows on-line editing, e.g. cut and paste, insertion/deletion, grouping, and special effects. In the interest of ease of editing, AV objects and their composition information are transmitted or accessed on separate logical channels (LCs). Objects which have a lifetime in the decoder beyond their initial presentation time are cached for reuse until a selected expiration time. The system includes a de-multiplexer (1), a controller (2) which controls the operation of the AV terminal, input buffers (3), AV objects decoders (4), buffers (4') for decoded data, a composer (5), a display (6), and an object cache (7).

OBJECT-BASED AUDIO-VISUAL TERMINAL AND BITSTREAM STRUCTURE

- ルハソ

Technical Field

This invention relates to the representation, transmission, processing and display of video and audiovisual information, more particularly of object-based information.

Background of the Invention

Image and video compression techniques have been developed which, unlike traditional waveform coding, attempt to capture high-level structure of visual content. Such structure is described in terms of constituent "objects" which have immediate visual relevancy, representing familiar physical objects, e.g. a ball, a table, a person, a tune or a spoken phrase. Objects are independently encoded using a compression technique that gives best quality for each object. compressed objects are sent to a terminal along with composition information which tells the terminal where to position the objects in a scene. The terminal decodes the objects and positions them in the scene as specified by the composition information. In addition to yielding coding gains, object-based representations are beneficial with respect to modularity, reuse of content, ease of manipulation, ease of interaction with individual image components, and integration of natural, camera-captured content with synthetic, computer-generated content.

Summary of the Invention

In a preferred architecture, structure or format for information to be processed at an object-based video or audio-visual (AV) terminal, an object-oriented bitstream includes objects, composition information, and

scene demarcation information. The bitstream structure allows on-line editing, e.g. cut and paste, insertion/deletion, grouping, and special effects.

In the preferred architecture, in the interest of ease of editing, AV objects and their composition information are transmitted or accessed on separate logical channels (LCs). The architecture also makes use of "object persistence", taking advantage of some objects having a lifetime in the decoder beyond their initial presentation time, until a selected expiration time.

Detailed Description

10

15

20

25

30

An audio-visual (AV) terminal is a systems component which is instrumental in forming, presenting or displaying audio-visual content. This includes (but is not limited to) end-user terminals with a monitor screen and loudspeakers, as well server and mainframe computer facilities in which audio-visual information is processed. In an AV terminal, desired functionality can be hardware-, firmware- or software-implemented. Information to be processed may be furnished to the terminal from a remote information source via a telecommunications channel, or it may be retrieved from a local archive, for example. An object-oriented audiovisual terminal more specifically receives information in the form of individual objects, to be combined into scenes according to composition information supplied to the terminal.

Fig. 1 illustrates such a terminal, including a de-multiplexer (DMUX) 1 connected via a logical channel LCO to a system controller or "executive" 2 and via logical channels LC1 through LCn to a buffer 3. The executive 2 and the buffer 3 are connected to decoders 4 which in turn are connected to a composer unit 5. Also, the executive 2 is connected to the composer unit 5 directly, and has an external input for user interaction, for example.

objects and their composition information are transmitted or accessed on separate logical channels. The DMUX receives the Mux2 layer from the lower layers and de-multiplexes it into logical channels. LCO carries composition information which is passed on to the executive. The AV objects received on other logical channels are stored in the buffer to be acted upon by the

2

decoders. The executive receives the composition information, which includes the decoding and presentation time stamps, and instructs the decoders and composer accordingly.

The system handles object composition packets (OCP) and object data packets (ODP). A composition packet contains an object's ID, time stamps and the "composition parameters" for rendering the object. An object data packet contains an object ID, an expiration time stamp in case of persistent objects, and object data.

5

10

15

20

25

30

Preferably, any external input such as user interaction is converted to OCP and/or ODP before it is presented to the executive. There is no need for headers in a bitstream delivered over a network. However, headers are required when storing an MPEG4 presentation in a file.

Figs. 2a and 2b illustrate the structure of composition and data packets in further detail. Relevant features are as follows:

Object ID is composed of object type and object number. The default length of the Object ID is 2 bytes, including ten bits for the object number and 6 for the object type (e.g. text, graphics, MPEG2 VOP, compound object). An extensible code is used to accommodate more than 1023 objects or more than 31 object types. The following convention will be adhered to: a value of Obl11111 in the first six bits of the Object ID corresponds to 31 plus the value of the byte immediately following the ObjectID; a value of Obl1.1111.1111 in the least significant 10 bits of the Object ID corresponds to 1023 plus the value of the two bytes immediately following the Object ID (without counting the object type extension bytes, if present). The following object types

are defined:

15

20

25

30

	Composition Objects	(16-bit object IDs)
	0X0000	scene configuration object
	0X0001	node hierarchy specification
5	0X0002	stream-node association
	0X0003	node/scene update
	0X0004	compound object
	Object Data (object	type, 6 most significant bits)
	0b00.0010	text
10	0b00.0011	MPEG2 VOP (rectangular VOP)

Persistent Objects (PO) are objects that should be saved at the decoder for use at a later time. An expiration time stamp (ETS) gives the life of a PO in milliseconds. A PO is not available to the decoder after ETS runs out. When a PO is to be used at a later time in a scene, only the corresponding composition information needs to be sent to the AV terminal.

Decoding Time Stamp (DTS) indicates the time an object (access unit) should be decoded by the decoder.

<u>Presentation Time Stamp</u> (PTS) indicates the time an object (access unit) should be presented by the decoder.

Lifetime Time Stamp (LTS) gives the duration (in milliseconds) an object should be displayed in a scene. LTS is implicit in some cases, e.g. in a video sequence where a frame is displayed for 1/frame-rate or until the next frame is available, whichever is larger. An explicit LTS is used when displaying graphics and text. An AV object should be decoded only once for use during its life time.

Expiration Time Stamp (ETS) is specified to support the notion of object persistence. An object, after it is presented, is saved at the decoder (cache) until a time given by ETS. Such an object can be used multiple times before ETS runs out. A PO with an expired ETS is no

longer available to the decoder.

5

10

15

25

Object Time Base (OTB) defines the notion of time of a given AV object encoder. Different objects may belong to different time bases. The AV terminal adapts these time bases to the local one, as specified in the MSDL VM.

Object Clock Reference (OCR) can be used if necessary to convey the speed of the OTB to the decoder. By this mechanism, OTBs can be recovered/adapted at the AV terminal.

Composition Parameters are used to compose a scene (place an object in a scene). These include displacement from the upper left comer of the presentation frame, rotation angles, zooming factors, etc.

<u>Priority</u> indicates the priority of an object for transmission, decoding, and display. MPEG4 supports 32 levels of priority. Lower numbers indicate higher priorities.

<u>Persistence Indicator</u> (PI) indicates whether an object is persistent.

20 <u>Continuation Indicator</u> (CI) indicates the end of an object in the current packet (or continuation).

Object Grouping facilitates operations to be applied to a set of objects with a single operation. Such a feature can be used to minimize the amount of composition information sent, as well as to support hierarchical scene composition based on independent sub-scenes. The composer manipulates the component objects as a group. The structure of a compound composition packet (CCP) is shown in Fig. 2c.

Bitstream Structure includes object composition packets for describing the composition and controlling the presentation of those packets, and object data packets that contain the data for the objects. A scene is composed by a set of composition packets. The

5

5

10

15

20

25

30

}

Scene Configuration Packet (SCP) is used to change reference scene width, height, to flush the buffer, and other configuration functions. The object type for SCPs is 0b00.0000. This allows for 1024 different configuration packets. The object number 0b00.0000.0000 (object ID 0X0000) is defined for use with flushing the terminal buffers.

Composition Control for Buffer Management (Object ID 0x0000)

AV terminal buffers are flushed using Flush_Cache and Scene_Update flags. When using hierarchical scene structure, the current scene graph is flushed and the terminal loads the new scene from the bitstream. Use of flags allows for saving the current scene structure instead of flushing it. These flags are used to update the reference scene width and height whenever a new scene begins. If the Flush_Cache_Flag is set, the cache is flushed, removing the objects (if any). If Scene_Update_Flag is set, there are two possibilities: (i) Flush_Cache-Flag is set, implying that the objects in the cache will no longer be used; (ii) Flush_Cache_Flag is not set, the new scene being introduced (an editing action on the bitstream) splices the current scene and the objects in the scene will be used after the end of The ETS of the objects, if any, will be the new scene. frozen for the duration of the new scene introduced. beginning of the next scene is indicated by another scene configuration packet.

```
Scene_Update_Flag 1 bit
if (Scene_Update_Flag) {
    ref_scene_width 12 bits
    ref_scene_height 12 bits
}
```

Composition Control for Scene Description (Object ID 0x0001)

A hierarchy of nodes is defined, describing a scene. The scene configuration packets can also be used to define a scene hierarchy that allows for a description of scenes as a hierarchy of AV objects. Each node in such a graph is a grouping of nodes that groups the leaves and/or other nodes of the graph into a compound AV object. Each node (leaf) has a unique ID followed by its parameters as shown in Fig. 3.

Composition Control for Stream-Node Mapping (Object ID 0x0002)

As illustrated by Fig. 4, table entries associate the elementary object streams in the logical channels to the nodes in a hierarchical scene. The stream IDs are unique, but not the node IDs. This implies that more than one stream can be associated with the same node.

25 <u>Composition Control for Scene Updates (Object ID</u> 0x0003)

Fig. 5 illustrates updating of the nodes in the scene hierarchy, by modifying the specific parameters of the node. The graph itself can be updated by adding/deleting the nodes in the graph. The update type in the packet indicates the type of update to be performed on the graph.

- Architectural Embodiment

20

30

The embodiment described below includes an

5.

10

15

20

25

30

object-based AV bitstream and a terminal architecture. The bitstream design specifies, in a binary format, how AV objects are represented and how they are to be composed. The AV terminal structure specifies how to decode and display the objects in the binary bitstream.

AV Terminal Architecture

Further to Fig. 1 and with specific reference to Fig. 6, the input to the de-multiplexer 1 is an object-based bitstream such as an MPEG-4 bitstream, consisting of AV objects and their composition information multiplexed into logical channels (LC). The composition of objects in a scene can be specified as a collection of objects with independent composition specification, or as a hierarchical scene graph. The composition and control information is included in LCO. The control information includes control commands for updating scene graphs, reset decoder buffers etc.

Logical channels 1 and above contain object date. The system includes a controller (or "executive") 2 which controls the operation of the AV terminal.

The terminal further includes input buffers 3, AV object decoders 4, buffers 4' for decoded data, a composer 5, a display 6, and an object cache 7. input bitstream may be read from a network connection or from a local storage device such as a DVD, CD-ROM or computer hard disk. LCO containing the composition information is fed to the controller. The DMUX stores the objects in LC1 and above at the location in the buffer specified by the controller. In the case of network delivery, the encoder and the stream server cooperate to ensure that the input object buffers neither overflow nor underflow. The encoded data objects are stored in the input data buffers until read by the decoders at their decoding time, typically given by an

associated decoding timestamp. Before writing a data object to the buffer, the DMUX removes the timestamps and other headers from the object data packet and passes them to the controller for signaling of the appropriate decoders and input buffers. The decoders, when signaled by the controller, decode the data in the input buffers and store them in the decoder output buffers. The AV terminal also handles external input such as user interaction.

In the object cache 7, objects are stored for use beyond their initial presentation time. Such objects remain in the cache even if the associated node is deleted from the scene graph, but are removed only upon the expiration of an associated time interval called the expiration time stamp. This feature can be used in presentations where an object is used repeatedly over a session. The composition associated with such objects can be updated with appropriate update messages. example, the logo of the broadcasting station can be downloaded at the beginning of the presentation and the same copy can be used for repeated display throughout a session. Subsequent composition updates can change the position of the logo on the display. Objects that are reused beyond their first presentation time may be called persistent objects.

System Controller(SC)

5

10

15

20

25

30

The system controller controls decoding and playback of bitstreams on the AV terminal. At startup, from user interaction or by looking for a session at default network address, the SC first initializes the DMUX to read from a local storage device or a network port. The control logic is loaded into the program RAM at the time of initialization. The instruction decoder reads the instructions from the program and executes

them. Execution may involve reading the data from the input buffers (composition or external data), initializing the object timers, loading or updating the object tables to the data RAM, loading object timers, or control signaling.

5

10

15

20

25

30

Fig. 7 shows the system controller in further The DMUX reads the input bitstream and feeds the composition data on LCO to the controller. composition data begins with the description of the first scene in the AV presentation. This scene can be described as a hierarchical collection of objects using compound composition packets, or as a collection of independent object composition packets. A table that associates the elementary streams with the nodes in the scene description immediately follows the scene description. The controller loads the object IDs (stream IDs) into object list and render list which are maintained in the data RAM. The render list contains the list of objects that are to be rendered on the display device. An object that is disenabled by user interaction is removed from the render list. A node delete command that is sent via a composition control packet causes the deletion of the corresponding object IDs from the object The node hierarchy is also maintained in the data RAM and updated whenever a composition update is received.

The composition decoder reads data from the composition and external data buffer and converts them into a format understood by the instruction decoder. The external input includes user interaction to select objects, disenable and enable objects and certain predefined operations on the objects. During the execution of the program, two lists are formed in the data RAM. The object list, containing a list of objects

(object IDs) currently handled by the decoders and a render list, containing the list of active objects in the scene. These lists are updated dynamically as the composition information is received. For example, if a user chooses to hide an object by passing a command via the external input, the object is removed from the render list until specified by the user. This is also how external input is handled by the system. Whenever there is some external interaction, the composition decoder reads the external data buffer and performs the requested operation.

5

10

15

20

25

30

The SC also maintains timing for each AV object to signal the decoders and decoder buffers of decoding and presentation time. The timing information for the AV objects is specified in terms of its time-base. terminal uses the system clock to convert an object's time base into system time. For objects that do not need decoding, only presentation timers are necessary. timers are loaded with the decoding and presentation timestamps for that AV object. The controller obtains the timestamps from the DMUX for each object. decoding timer for an object runs out, the appropriate decoder is signaled to read data from the input buffers and to start the decoding process. When a presentation timer runs out, the decoded data for that object is transferred to the frame buffer for display. A dual buffer approach could be used to allow writing to a frame buffer while the contents of the second buffer are displayed on the monitor. The instruction decoder can also reset the DMUX or input buffers by signaling a reset, which initializes them to the default state.

Information Flow in the Controller

Fig. 8 shows the flow of information in the controller. To keep the figure simple, the operations

5

10

15

20

25

30

performed by the instruction decoder are shown in groups. The three groups respectively concern object property modifications, object timing, and signaling.

Object Property Modifications

These operations manipulate the object IDs, also called elementary stream IDs. When a scene is initially loaded, a scene graph is formed with the object IDs of the objects in the scene. The controller also forms and maintains a list of objects in the scene (object list) and active objects in the object from the render list. Other operations set and update object properties such as composition parameters when the terminal receives a composition packet.

Object Timing

This group of operations deals with managing object timers for synchronization, presentation, and decoding. An object's timestamp specified in terms of its object time base is converted into system time and the presentation and decoding time of that object are set. These operations also set and reset expiration timestamps for persistent objects.

Signaling

Signaling operations control the over-all operation of the terminal. Various components of the terminal are set, reset and operated by controller signaling. The controller checks the decoding and presentation times of the objects in the render list and signals the decoders and presentation frame buffers accordingly. It also initializes the DEMUX for reading from a network or a local storage device. At the instigation of the controller, decoders read the data from the input buffers and pass the decoded data to decoder output buffers. The decoded data is moved to the presentation device when signaled by the controller.

WE CLAIM:

1. A method for displaying object-based audio-

- visual/video data, comprising:
- 3 (a) receiving, over time, a plurality of audio-
- 4 visual/video objects and composition information for the
- 5 objects;
- 6 (b) storing in a cache memory at least one of
- 7 the objects;
- 8 (c) composing scenes from said objects
- 9 including the one of the objects stored in the cache
- 10 memory; and
- 11 (d) displaying the composed scenes.
 - 1 2. The method of claim 1, further comprising, in
 - 2 addition to storing the one of the objects, storing
 - 3 expiration time data for the one of the objects.
 - 1 3. The method of claim 1, with at least one of the
 - 2 objects being received from a network connection.
 - 1 4. The method of claim 1, with at least one of the
 - 2 objects being received from local memory.
 - 1 5. The method of claim 1, with at least one of the
 - 2 objects being received from local memory and at least one
 - 3 other of the objects being received from a network
 - 4 connection, and with the composed scenes comprising the
 - 5 one and the other of the objects.
 - 1 6. The method of claim 1, further comprising
 - 2 responding to interactive user input.
 - 7. The method of claim 6, wherein responding

- 2 comprises at least one of selecting, enabling and
- 3 disenabling one of the objects.
- 8. Apparatus for displaying object-based audio-
- visual/video data, comprising:
- 3 (a) a controller circuit for controlling
- 4 /acquisition over time of a plurality of audio-
- 5 visual/video objects and composition information for the
- 6 objects;
- 7 (b) a cache memory for storing at least one of
- 8 the objects;
- 9 (c) a composer circuit, coupled to the cache
- 10 memory, for composing scenes from said video objects
- including the one of the objects stored in the cache
- 12 memory; and
- (d) a display for the composed scene.
 - 9. Apparatus for displaying object-based audio-
 - visual/video data, comprising a processor which is
 - 3 instructed for:
- 4 (a) controlling acquisition over time of a
- 5 plurality of audio-visual/video objects and composition
- 6 information for the objects;
- 7 (b) storing in a cache memory at least one of
- 8 the objects;
- 9 (c) composing scenes from said video objects
- including the one of the objects stored in the cache
- 11 memory; and
- 12 (d) displaying the composed scenes.
 - 1 10. Apparatus for displaying object-based audio-
 - visual/video data, comprising:
 - 3 · · · (a) means for controlling acquisition over
 - 4 time of a plurality of audio-visual/video objects and

5	composition information for the objects;
6	(b) means for for storing in a cache memory at
7	least one of the objects;
8	(c) means, coupled to the cache memory, for
9	composing scenes from said video objects including the
10	one of the objects stored in the cache memory; and
11	(d) means for displaying the scene.

Box III TEXT OF THE ABSTRACT (Continuation of item 5 of the first sheet)

NEW ABSTRACT

As information to be processed at an object-based video or audio-visual (AV) terminal, an object-oriented bitstream includes objects, composition information, and scene demarcation information. Such bitstream structure allows on-line editing, e.g. cut and paste, insertion/deletion, grouping, and special effects. In the interest of ease of editing, AV objects and their composition information are transmitted or accessed on separate logical channels (LCs). Objects which have a lifetime in the decoder beyond their initial presentation time are cached for reuse until a selected expiration time. The system includes a de-multiplexer (1), a controller (2) which controls the operation of the AV terminal, input buffers (3), AV object decoders (4), buffers (4') for decoded data, a composer (5), a display (6), and an object cache (7).

NOTES TO FORM PCT/ISA/220

These Notes are intended to give the basic instructions concerning the filing of amendments under Article 19. The Notes are based on the requirements of the Patent Cooperation Treaty and of the Regulations and the Administrative Instructions under that Treaty. In case of discrepancy between these Notes and those requirements, the latter are applicable. For more detailed information, see also the PCT Applicant's Guide, a publication of WIPO.

In these Notes, "Article", "Rule" and "Section" refer to the provisions of the PCT, the PCT Regulations and the PCT Administrative Instructions, respectively.

INSTRUCTIONS CONCERNING AMENDMENTS UNDER ARTICLE 19

The applicant has, after having received the international search report, one opportunity to amend the claims of the international application. It should however be emphasized that, since all parts of the international application (claims, description and drawings) may be amended during the international preliminary examination procedure, there is usually no need to file amendments of the claims under Article 19 except where, e.g. the applicant wants the latter to be published for the purposes of provisional protection or has another reason for amending the claims before international publication. Furthermore, it should be emphasized that provisional protection is available in some States only.

What parts of the international application may be amended?

The claims only.

The description and the drawings may only be amended during international preliminary examination under Chapter II.

When? Within 2 months from the date of transmittal of the international search report or 16 months from the priority date, whichever time limit expires later. It should be noted, however, that the amendments will be considered as having been received on time if they are received by the International Bureau after the expiration of the applicable time limit but before the completion of the technical preparations for international publication (Rule 46.1).

Where not to file the amendment ?

The amendments may only be filed with the International Bureau and not with the receiving Office or the International Searching Authority (Rule 46.2).

Where a demand for international preliminary examination has been/is filed, see below.

How? Either by cancelling one or more entire claims, by adding one or more new claims or by amending the text of one or more of the claims as filed.

A replacement theet must be submitted for each thest of the claims which, on account of an amendment or amendments, differs from the thest originally filed.

All the claims appearing on a replacement sheet must be numbered in Arabic numerals. Where a claim is cancelled, no renumbering of the other claims is required. In all cases where claims are renumbered, they must be renumbered consecutively (Administrative Instructions, Section 205(b)).

What document most may eccampany the amendments?

Letter (Section 205(b)):

The amendments must be submitted with a letter.

The letter will not be published with the international application and the amended claims. It should not be confounded with the "Statement under Article 19(1)" (see below, under "Statement under Article 19(1)").

The letter must indicate the differences between the claims as filed and the claims as amended. It must, in particular, indicate, in connection with each claim appearing in the international application (it being understood that identical indications concerning several claims may be grouped), whether

- (i) the claim is unchanged;
- (ii) the claim is cancelled;
- (iii) the claim is new;
- (iv) the claim replaces one or more claims as filed;
- (v) the claim is the result of the division of a claim as filed.

Applicant

THE TRUSTEES OF COLUMBIA UNIVERSITY IN THE CITY OF NEW YORK et al

1. The applicant is hereby informed that the International Bureau has, according to Article 31(7), notified each of the following Offices of its election:

EP:AT,BE,CH,DE,DK,ES,FI,FR,GB,GR,IE,IT,LU,MC,NL,PT,SE

National :CA,JP,US

2. The following Offices have waived the requirement for the notification of their election; the notification will be sent to them by the International Bureau only upon their request:

None

3. The applicant is reminded that he must enter the "national phase" before the expiration of 30 months from the priority date before each of the Offices listed above. This must be done by paying the national fee(s) and furnishing, if prescribed, a translation of the international application (Article 39(1)(a)), as well as, where applicable, by furnishing a translation of any annexes of the international preliminary examination report (Article 36(3)(b) and Rule 74.1).

Some offices have fixed time limits expiring later than the above-mentioned time limit. For detailed information about the applicable time limits and the acts to be performed upon entry into the national phase before a particular Office, see Volume II of the PCT Applicant's Guide.

The entry into the European regional phase is postponed until 31 months from the priority date for all States designated for the purposes of obtaining a European patent.

THE TRUSTEES OF COLUMBIA UNIVERSITY IN THE CITY OF NEW YORK et al

 Notice is hereby given that the International Bureau has communicated, as provided in Article 20, the international application to the following designated Offices on the date indicated above as the date of mailing of this Notice: CA,EP,JP,US

In accordance with Rule 47.1(c), third sentence, those Offices will accept the present Notice as conclusive evidence that the communication of the international application has duly taken place on the date of mailing indicated above and no copy of the international application is required to be furnished by the applicant to the designated Office(s).

2. The following designated Offices have waived the requirement for such a communication at this time:

None

The communication will be made to those Offices only upon their request. Furthermore, those Offices do not require the applicant to furnish a copy of the international application (Rule 49.1(a-bis)).

3. Enclosed with this Notice is a copy of the international application as published by the International Bureau on 20 August 1998 (20.08.98) under No. WO 98/36559

REMINDER REGARDING CHAPTER II (Article 31(2)(a) and Rule 54.2)

If the applicant wishes to postpone entry into the national phase until 30 months (or later in some Offices) from the priority date, a demand for international preliminary examination must be filed with the competent International Preliminary Examining Authority before the expiration of 19 months from the priority date.

It is the applicant's sole responsibility to monitor the 19-month time limit.

Note that only an applicant who is a national or resident of a PCT Contracting State which is bound by Chapter II has the right to file a demand for international preliminary examination.

REMINDER REGARDING ENTRY INTO THE NATIONAL PHASE (Article 22 or 39(1))

If the applicant wishes to proceed with the international application in the **national phase**, he must, within 20 months or 30 months, or later in some Offices, perform the acts referred to therein before each designated or elected Office.

For further important information on the time limits and acts to be performed for entering the national phase, see the Annex to Form PCT/IB/301 (Notification of Receipt of Record Copy) and Volume II of the PCT Applicant's Guide.

ATTENTION

The applicant should carefully check the data appearing in this Notification. In case of any discrepancy between these data and the indications in the international application, the applicant should immediately inform the International Bureau.

In addition, the applicant's attention is drawn to the information contained in the Annex, relating to:

X time limits for entry into the national phase;

X confirmation of precautionary designations;

requirements regarding priority documents.

A copy of this Notification is being sent to the receiving Office and to the International Searching Authority.

Facsimile No. (41-22) 740.14.35

Telephone No. (41-22) 338.83.38

INFORMATION ON TIME LIMITS FOR ENTERING THE NATIONAL PHASE

The applicant is reminded that the "national phase" must be entered before each of the designated Offices indicated in the Notification of Receipt of Record Copy (Form PCT/IB/301) by paying national fees and furnishing translations, as prescribed by the applicable national laws.

The time limit for performing these procedural acts is **20 MONTHS** from the priority date or, for those designated States which the applicant elects in a demand for international preliminary examination or in a later election, **30 MONTHS** from the priority date, provided that the election is made before the expiration of 19 months from the priority date. Some designated (or elected) Offices have fixed time limits which expire even later than 20 or 30 months from the priority date. In other Offices an extension of time or grace period, in some cases upon payment of an additional fee, is available.

In addition to these procedural acts, the applicant may also have to comply with other special requirements applicable in certain Offices. It is the applicant's responsibility to ensure that the necessary steps to enter the national phase are taken in a timely fashion. Most designated Offices do not issue reminders to applicants in connection with the entry into the national phase.

For detailed information about the procedural acts to be performed to enter the national phase before each designated Office, the applicable time limits and possible extensions of time or grace periods, and any other requirements, see the relevant Chapters of Volume II of the PCT Applicant's Guide. Information about the requirements for filing a demand for international preliminary examination is set out in Chapter IX of Volume I of the PCT Applicant's Guide.

GR and ES became bound by PCT Chapter II on 7 September 1996 and 6 September 1997, respectively, and may, therefore, be elected in a demand or a later election filed on or after 7 September 1996 and 6 September 1997, respectively, regardless of the filing date of the international application. (See second paragraph above.)

Note that only an applicant who is a national or resident of a PCT Contracting State which is bound by Chapter II has the right to file a demand for international preliminary examination.

CONFIRMATION OF PRECAUTIONARY DESIGNATIONS

This notification lists only specific designations made under Rule 4.9(a) in the request. It is important to check that these designations are correct. Errors in designations can be corrected where precautionary designations have been made under Rule 4.9(b). The applicant is hereby reminded that any precautionary designations may be confirmed according to Rule 4.9(c) before the expiration of 15 months from the priority date. If it is not confirmed, it will automatically be regarded as withdrawn by the applicant. There will be no reminder and no invitation. Confirmation of a designation consists of the filing of a notice specifying the designated State concerned (with an indication of the kind of protection or treatment desired) and the payment of the designation and confirmation fees. Confirmation must reach the receiving Office within the 15-month time limit.

REQUIREMENTS REGARDING PRIORITY DOCUMENTS

For applicants who have not yet complied with the requirements regarding priority documents the following is recalled.

Where the priority of an earlier national (i.e., national or regional) application is claimed, the applicant must submit a copy of the said national application, certified by the authority with which it was filed ("the priority document") to the receiving Office (which will transmit it to the International Bureau) or directly to the International Bureau, before the expiration of 16 months from the priority date (Rule 17.1).

Where the priority document is issued by the receiving Office, the applicant may, instead of submitting the priority document, request the receiving Office to prepare and transmit the priority document to the International Bureau. Such request must be made before the expiration of the 16-month time limit.

It is recalled that, where several priorities are claimed, the priority date to be considered for the purposes of computing the 16-month time limit is the filing date of the earliest application whose priority is claimed.

If the priority document concerned is not submitted to the International Bureau before the expiration of the 16-month time limit, or if the request to the receiving Office to transmit the priority document has not been made (and the corresponding fee, if any, paid) before the expiration of this time limit, any designated State may disregard the priority claim.
